

Limited Visual Dam Safety Inspection Summary Report

MA-056

Hanakaoo Reservoir

Maui, Hawaii

Prepared by:

U.S. ARMY CORPS OF ENGINEERS HONOLULU ENGINEER DISTRICT

STATE OF HAWAII
DEPARTMENT OF LAND AND NATURAL RESOURCES

May 2006

Dam ID:	MA-0056
Name: <u>H</u>	anakaoo Reservoir

Limited Visual Dam Safety Inspection Conducted on: 04 April 2006

I. Purpose

Due to disaster occurrences of periodic heavy rains and flooding, which has caused extensive damage to property and loss of lives, the Governor has issued a State of Emergency Proclamation extending from February 20, 2006 to April 9, 2006. In light of the tragic failure of the Kaloko dam on Kauai and the continued forecast of heavy rains, emergency inspections of all regulated dams in all counties are being undertaken.

These inspections are for the purpose of determining if any of the regulated dams and reservoirs in the City and County of Honolulu, Maui County or Hawaii County, are suspect for immediate concern to the downstream area under the prolonged conditions of heavy rain showers.

II. Authority

Inspections are authorized under the Hawaii Dam Safety Act of 1987, Chapter 179D "Dams and Reservoirs" of Hawaii Revised Statues, and Title 13, Subtitle 7, Chapter 190, "Dams and Reservoirs" of the Hawaii Administrative Rules.

These inspections are being conducted under joint agreements of the U.S. Army Corps of Engineers (USACE), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), and the State of Hawaii. The Memorandum of Agreement with the U.S. Army Corps of Engineers is entered into pursuant to 10 U.S.C. § 3036(d)(2), and the Intergovernmental Cooperation Act (31 U.S.C. §6505), and established via support agreement number DL-06-01.

III. Scope

Visual inspection will be made on parts of the embankment and appurtenant works readily available and visible for inspection by the inspection team at the time of the inspection. Such parts and appurtenant works would include the upstream slope, crest, downstream slope, abutments and toes, outlet works, and spillway.

On the date of this limited visual inspection, there may appear to be no immediate threat to the safety of the dam, however no assurance can be made regarding the dam's condition after this date. Subsequent adverse weather and other factors may affect the dam's condition.

Dam ID: <u>MA-0056</u>

Name: Hanakaoo Reservoir

IV. Limitations of Findings and Recommendations

The inspection is based only on visible features/areas of the dam on the day of inspection. The inspection does not entail detailed stability, hydrologic, hydraulic, or seismic investigations. This inspection is not a formal phase I or phase II dam safety inspection and does not include a review or evaluation from each specialist of an inspection team, such as a geologists, civil, geotechnical, structural, or hydraulics engineer. The owner should verify the findings of this report and take corrective actions. The owner may submit to the State alternative corrective actions that are certified by a licensed professional engineer in the State of Hawaii experienced in the design and construction of dams. This inspection does not relieve the owner/operator from their responsibility to conduct routine inspections, maintenance, repairs, modifications, monitoring, documentation, and/or investigative studies.

V. Inspection Team

Organization Name / Title

LLS Army Corps of Engineers

Troy O'Neal E

U.S. Army Corps of Engineers

Troy O'Neal, P.E.

Geotechnical Engineer

VII. Inspection Team

<u>Organization</u> <u>Name</u>

U.S. Army Corps of Engineers

Derek Chow
Bill Empson

State of Hawaii, Dept. of Land and Natural Resources Denise Manuel

Edwin Matsuda

VIII. Dam Type

The dam appeared to be an earthen embankment dam.

Dam ID: <u>MA-0056</u>

Name: Hanakaoo Reservoir

IX. Dam Classification

The current hazard classification of this dam is: High

Hazard Potential Classification based on the following:

Category	Loss of Life	Economic Loss
Low	None Expected	Minimal (undeveloped to
		occasional structures
		or agriculture)
Significant	Few (No Urban development and	Appreciable (Notable
	no more than a small	agriculture, industry or
	number of inhabitable	structures)
	structures)	
High	More than a few	Extensive community, industry
		or agriculture.

Based on inventoried storage and height data, the size classification of the dam is: Most likely small but insufficient information is available to inspectors to make a determination.

Size Classification based on the following:

Category	Storage (Acre-Feet)	Height (feet)
Small	< 1000	< 40
Intermediate	> 1000 and < 50,000	> 40 and < 100
Large	> 50,000	> 100

X. Summary of Inspection

Condition Rating Criteria: The conditional terms in this report are used to generally describe the conditions below. Inspections, monitoring, and additional investigations are considered to be incidental to all condition ratings.

Satisfactory Expected to fulfill intended function.

Fair Expected to fulfill intended function, but maintenance is

recommended.

Poor May not fulfill intended function; maintenance or repairs are

necessary.

Unsatisfactory Is not expected to fulfill intended function; repair, replacement, or

modification is necessary.

Unknown Not visible, not accessible, not inspected, or unable to determine

the condition rating based on the observation taken.

A. General appearance:

The Hanakaoo reservoir is characterized by an "L" shaped embankment along the north and west sides with grouted rock paving on the upstream slope. The inlet pipe reported to be along the southeast end of the reservoir was hidden and inaccessible due to heavy overgrowth. The outlet works consist of a 12-inch siphon PVC pipe over the dam. The original outlet works going through the downstream embankment was plugged and abandon after the Horner Dam failure. The dam is about 25 feet in height and appears to have a significant drainage area.

Findings and Corrective Actions:

- a. The Owner shall maintain documentations including Construction plans, specifications, improvements, modifications, Operations and Maintenance Manuals and routine inspection logs for this dam facility.
- b. An EAP is required for High Hazard Dams. Submit an updated EAP for this facility.
- c. Submit narrative and additional information detailing the improvements, modifications, and/or alterations at the dam site, unless covered by approved dam permit.
- d. Routine inspection logs were not inspected.
- e. The dam did not appear to be maintained on a regular basis.
- f. Access to site appears to be satisfactory.
- g. Submit current Operations and Maintenance Manual or Procedures for this dam / reservoir facility.
- h. Submit Site or Facility Map of this Dam which identifies the location of major features including outlet works controls and conduits.
- i. Emergency Alarms / Monitors: There were no alarms or monitors observed on this reservoir.
- j. Power / Communication: There were no communication systems observed on this reservoir.

B. Access / Security:

Access to the dam was accomplished via a County roadway and dirt road. A four-wheel drive vehicle was required to access the site.

Security issues: Access to the dam is unrestricted.

C. Intake Works: (Unknown)

The inlet consisted of an 8" diameter pipe of unknown type of material. The intake works was inaccessible due to heavy overgrowth of vegetation and silting in the area.

Findings and Corrective Actions:

- a. The intake works were not inspected.
- b. The intake works were not tested.

D. Reservoir: (Fair)

The reservoir was less than elevation 1283 feet at the time of observation based on the known elevation of the spillway. The normal operating level is seasonal but is kept near the same level except during drought conditions. A staff gage did not exist.

Findings and Corrective Actions:

- a. The reservoir appeared to be in fair condition and requires corrective action due to heavy vegetation and it being silted in.
- b. A staff gage was not observed at the reservoir. Provide some method of quantifying the water level within the reservoir.

E. Upstream Slope: (Satisfactory)

The upstream slope was 1 on 1 consisting of grouted rip rap. The upstream slope had some bushes and tall grass growing in the mortar joints.

Findings and Corrective Actions:

- a. The upstream slope appeared to be in satisfactory condition, no corrective actions are required at this time.
- **b.** Slope protection needs maintenance or repair. Remove bushes.

F. Crest: (Fair)

The dam crest was approximately 20 feet wide. There was a dirt access road on top of the crest, and the condition was generally good.

Findings and Corrective Actions:

- a. The dam crest appeared to be in fair to poor condition and requires corrective action.
- b. Access along the crest was satisfactory.
- c. Portions of the crest were not visible due to high grass and bush vegetation. Clear high vegetation and maintain low to enable easy visual inspection.

G. Downstream Slope: (Fair)

The downstream slope was approximately 3/4 on 1. There was no access other than on foot to the downstream slope and toe. The downstream slope appeared to have large rock placements along discrete points of the slope while other sections were inaccessible due to heavy vegetation. Sinkholes were not visible on the downstream slope. Seepage was not visible on the downstream toe.

Findings and Corrective Actions:

- a. The downstream slope appeared to be in fair to poor condition and requires corrective action.
- b. The downstream slope was not visible due to high grass and bush vegetation. Clear high vegetation and maintain low to enable easy visual inspection.
- c. Tree(s) were observed on the downstream slope. Trees have been identified as the probable cause of piping failures, and can possibly cause severe damage to

the embankment if they are uprooted during high winds. Corrective action is required to remove tree hazards from the dam. Acceptable remedies include removal of the tree and its root structure down to a 2" diameter and reconstructing the damaged embankment section. All repair work shall be accomplished as per the requirements of licensed geotechnical or structural engineer. Routinely monitor the damaged area for signs of settlement and seepage.

d. The slope was very steep, around a 1 to 1 slope ratio; further study is required to verify slope stability.

H. Abutments / Toe: (Fair)

In a few relatively small locations, the abutments and toe were not entirely visible or identifiable due to tall grass; however, the abutments appeared to have good connection. The toe was observed to have heavy overgrowth.

Findings and Corrective Actions:

- a. The toe appeared to be in fair to poor condition and requires corrective action.
- b. The toe area was not visible due to high grass and bush vegetation. Clear high vegetation and maintain low to enable easy visual inspection.

I. Outlet Works: (Satisfactory)

The outlet works consisted of a 12" diameter PVC siphon pipe. The outlet works control was located on the downstream side by a valve. This modification was made after the nearby Horner Dam failure in 1988.

Findings and Corrective Actions:

- a. The outlet works were not tested.
- b. The outlet works appeared to be in satisfactory condition, no corrective actions are required at this time.
- c. PVC modification approximately 18 years ago.

J. Spillway: (Fair)

This spillway was overgrown with vegetation and was blocked. There was no erosion observed near the spillway.

Findings and Corrective Actions:

- a. The Spillway appeared to be in fair to poor condition and requires corrective action. (Needs clearing.)
- b. The spillway approach was blocked. Clear approach.

K. Down Stream Channel: (Unknown)

The down stream channel was undetected.

Findings and Corrective Actions:

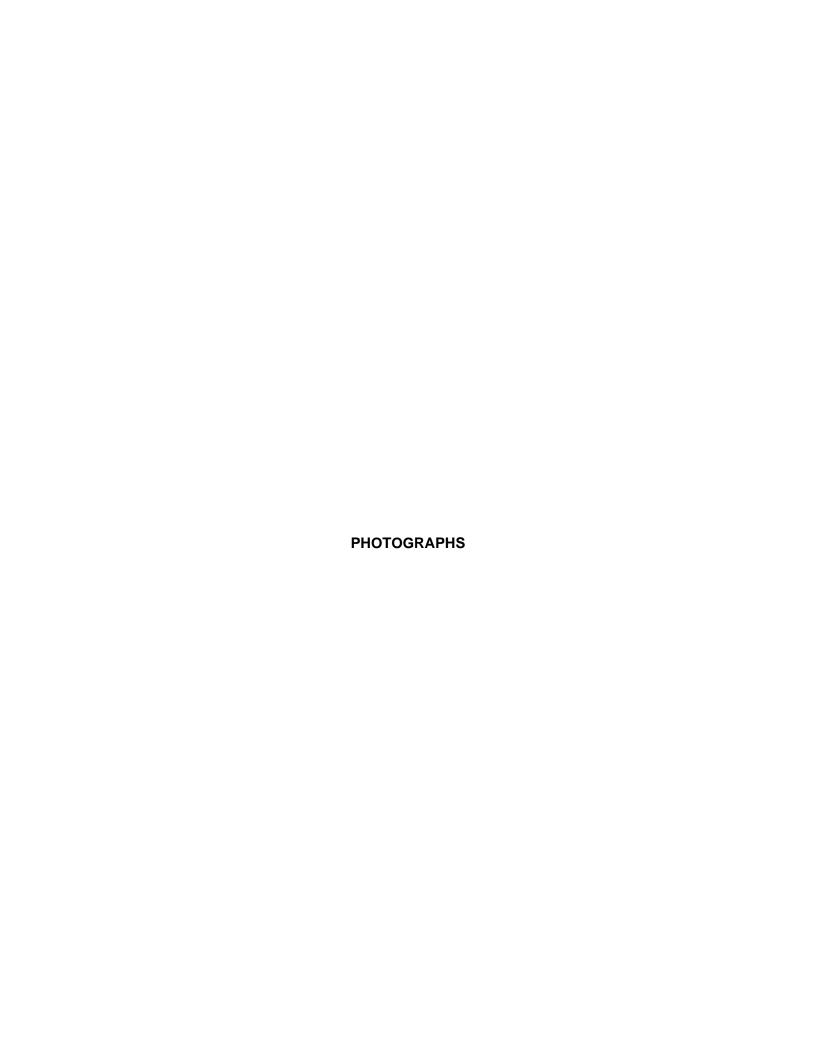

a. The downstream channel was not inspected.

XI. Additional Comments:

Based on visual observations and discussion of operational procedures of the dam, there is no immediate threat to the safety of the dam at this time.

Heavy growth needs to be removed to promote visual inspection of slopes.

Capacity of reservoir has been reduced by silting into reservoir.

056 Upstream view of reservoir looking from crest.

056 Downstream view of crest - View of crest and reported inlet area on right end of reservoir (inaccessible).

056 View of left side upslope from crest.

056 PVC slip modification leading out of old DIP outlet. (12-inch dia.)

056 Tree Growth at Crest - Massive tree growth on crest and down slope.

Dam ID: <u>MA-0056</u> HANAKAOO RESERVOIR

Dam ID: MA-0056 HANAKAOO RESERVOIR	Inspection No: Date:4/4/06
Additional Comments:	and the second to be an immediate threat to the cofety of the

On the date of this limited visual inspection, there appeared to be no immediate threat to the safety of the dam. No assurance can be made regarding the dam's condition after this date. Subsequent adverse weather and other factors may affect the dam's condition.

1) BASED ON VISUAL OBSERVATIONS AND DISCUSSION OF OPERATIONAL
PROCEDURES OF THE DAM, THERE IS NO IMMEDIATE THREAT TO THE
SAFETY OF THE DAM AT THIS TIME.
Z) HEAVY GROWTH NEEDS TO BE REMOVED TO PROMOTE UTSUAL
INSPECTION OF SLOPES.
3) CAPACITY OF RESERVOIR HAS BEEN REDUCED BY SILTING.
INTO RESERVOIR,

Limitations and Intent of this Dam Safety Inspection:

This Dam Safety Inspection was conducted to assess the general overall condition of the reservoir/dam, identify visible deficiencies, and recommend areas of for monitoring, additional investigative studies and corrective actions. The inspection is based only on visible features/areas of the dam on the day of inspection. This inspection is not a formal phase I or phase II dam safety inspection and does not include a review or evaluation from each specialist of an inspection team, such as a geologists, civil, geotechnical, structural, or hydraulics engineer. The owner should verify the findings of this report and take corrective actions. The owner may submit to the State alternative corrective actions that are certified by a licensed professional engineer in the State of Hawaii experienced in the design and construction of dams. This inspection does not relieve the owner/operator from their responsibility to conduct routine inspections, maintenance, repairs, modifications, monitoring, documentation, and/or investigative studies. The inspection was conducted under the authority of the Hawaii Revised Statures Chapter 179D, and Hawaii Administrative Rules, Title 13, Chapter 190, titled "Dams and Reservoirs". Questions regarding this inspection should be forwarded to the Hawaii State Dam Safety Program; PO Box 373; Honolulu, Hawaii 96809; Ph. (808) 587-0236.

Revised: Dec. 1, 2003
